E-mail enquiries: zface@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone Apr 29, 2002 this sequence version replaced gi:20268901.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VRT 16-AUG-2002

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, B., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 511-8. The clone may be obtained aither from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
                                                                                                                                                                                                                                                  NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                       This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality date (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-252K7, 2000 bp overlap.
Actual start of this clone is at base position 106699 of
RP11-252K7; actual end is at base position 126118 of RP11-182K3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7525. .7604

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2189 rigogradaracaacrocorricadaracraarararaacrirriraaaaacarararring 2130

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL10511), expressed DNA sequences (ABL16176-ABL10511) expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3345
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3285
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 5823 BP; 1606 A; 1327 C; 1289 G; 1601 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 42056; 21pp + Sequence Listing; English

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ADDS, eppliepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

Novel nucleic acid useful

for diagnosis and therapy

of behavioral

```
The invention relates to nucleic acids comprising a segment of chemically pretreated DNA of adrenergic alpha-1C-receptor gene. The invention also betalates to oligonuclectides or peptide nucleic acid (PNA) oligomers useful for detecting cytosine methylations. The pretreated DNA is useful for the diagnosis or therapy of behavioural disorders, neurological disorders and cancer, in particular major depressive disorder, Tourette's syndrome, schizophrenia, psychiatric and neurological disorders, smoking, drug abuse, alcoholism, personality traits, compulsive gambling, human and schizoaffective patients, and sucidal behaviours in schizophrenic and schizophrenia. The nucleic acid is useful for detecting the methylation state of all CpG dinucleotides and/or single nucleotide polymorphisms (SNPS). The present sequence is human chemically treated genomic DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3147 Archaartraacccaaarcraacraaarccaaaacccarcrirraarcrarara 3088

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For certain the precipitying mutations or deletions in a patient's genome cappelement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the secreted to prevent.

CC diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-NOV-2000;

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 39112; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM8210 to AAM91921. (I) have cytostatic
acituity, and can be used in gene therapy and vaccine production. (I)
acituity, and can be used in gene therapy and vaccine production. (I)
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
cytostation by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
cyplomucleotides may be used to production of (I). Additionally, (I)
cyplomicleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
cyclein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic derived cells. AAK64703
cyclein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of haematopoietic antigen genomic
cyclein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of haematopoietic antigen genomic
cyclein. (I) expressent invention. AAK54950 and AAM82169
cyclein. (I) expressent invention. AAK54950 and AAM82169
cyclein. (I) expressent invention.

AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
creample, they may be used to treat disorders associated with decreased
c example, they may be used to treat disorders associated with decreased
cc expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
c supplement the patients own production of (I). Additionally, (I)
c supplement the patients own production of (I). Additionally, (I)
c polynucleotides may be used to produce the secreted (I), by inserting
cc the nucleic acids into a host cell and culturing the cell to express the
creancers and cancer metastases of haematopoietic-derived cells. AAK64703
cc cancers and cancer metastases of haematopoietic-derived cells. AAK64703
cc cancers and cancer metastases of haematopoietic antigen genomic
c to AAK87694 represent human immune/haematopoietic antigen genomic
c represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2563 TATTTGTAGGAATGCCAACTCATTTTAAATTTTTTTTGCATTTGCAACATTTTTC 2622

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukeamia, Alzheimer's disease, Alls, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2241 iririridrakdariaririrraarrakidecederirirarrakrirarrakrakraka 2300

The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the
                                          Sequence 38342 BP; 11153 A; 472 C; 7565 G; 19152 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 53 since numbers 408, 458 and 500 are missing from the sequence listing) sequences, and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form the sequences.
                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   15-MAR-2000;

                                                                                                                                                                                                                                     CC signal transduction associated genes. The DNA sequences are chemically CC modified using a solution of bisulphite, hydrogen sulphite or disulphite. Also disclosed are oligonucleotides and/or PNA oligoners CC for detecting the cytosine methylation state (CpG islands) of these CC genes, and a method for the diagnosis and/or therapy of genetic and CC gengenchic parameters of genes associated with signal transduction. CC contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, CC cortain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, CC crebral-spinal fluid, tissue embedded in paratfin such as tissue from CC eyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, CC histologic object slides, and all their possible combinations. The CC diseases associated with signal transduction e.g. solid tumours and CC sequences of the invention are useful for the diagnosis and therapy of classases associated with signal transduction e.g. solid tumours and CC sequences of different genes associated with signal transduction, or their complementary camesons associated with signal transduction, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABK31506

The present invention describes an isolated dysferlin DNA of 20-25

uncleotides in length, comprising a nucleotide sequence specifically
selected from nucleotides 911-913, 929-948, 1019-1038, 1392-1411,

This invention describes a novel human dysferlin nucleic acid (I) and its encoding protein (II), which has anti-dystrophic activity and can be used for gene therapy. Introduction of (I), a vector comprising (I) or dysferlin into a cell of a mammal can be used to decrease the symptoms of muscular dystrophy. The dysferlin gene is normally expressed in skeletal muscle cells and is selectively mutated in several families with the hereditary muscular dystrophies, e.g. Miyoshi myopathy and limb girdle muscular dystrophies and oligonucleotides derived from (I) can be used in diagnosis of or risk identification for dysferlin-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disorders in patients, fetus, or pre-embryos. Expression of brain-specific dysferlin may be important as a marker for normal neural development. Dysferlin DNA or subgenomic coding sequences can be used for therapy of the hereditary muscular dystrophies. This sequence represents a fragment of the human dysferlin gene described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel dysferlin genes and related proteins useful for diagnosis, risk identification and treatment of hereditary muscular dystrophies and other dysferlin related disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps

The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haemostatic, hemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotactic/chemotac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotides encoding human secreted proteins - derived e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Expressed sequence tag; secreted protein; haematopoiesis regulator; tissue growth; activin; inhibin; tumour invasion suppressor; EST; human; chemotaxis; chemokinesis; haemostasis; gene therapy; thrombolysis; receptor; ligand; anti-inflammatory; tumour inhibitor; ds.

                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

Sequence 5, Application US/09362642
Patent No. 6350935
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Bennett, Alan B.
APPLICANT: Rose, Jocelyn K.C.
APPLICANT: The Regents of the University of California
TITLE OF INVENTION: Fruit Specific and Ripening Regulation Expansin Genes
FILE REPERENCE: 023070-078210US
FULE REPERENCE: 023070-078210US
CURRENT APPLICATION NUMBER: US/09/362,642
CURRENT FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 8
                                                                                                                                                                                                                                                                                                                                238 GGCTATGACTTCAGCTACACTGGACAAACTGCTCTCTACAACCAGGCTGGATGCAGT 297

| Sequence 1, Application US/08973462B
| Patent No. 6191270
| GENERAL INFORMATION:
| APPLICANT: DAUBERSIES, PIERRE
| APPLICANT: DAUBERSIES, PIERRE
| TITLE OF INVENTION: MALARIAL PRE-ERYTHROCYTIC STAGE POLYPEPTIDE MOLECULES
| FILE REFERENCE: 0660-0125-0 PCT
| CURRENT APPLICATION NUMBER: US/08/973,462B
| CURRENT FILING DATE: 1998-02-06
| EARLIER APPLICATION NUMBER: PCT/FR96/00894
| EARLIER FILING DATE: 1996-06-12
| EARLIER FILING DATE: 1995-06-13
| NUMBER OF SEQ ID NOS: 29
| SOPTWARE: PATENTIN OLYTE: 1995-06-13
| NUMBER OF SEQ ID NOS: 29
| SOFTWARE: PATENTIN Ver. 2.0
| TYPE: DNA
| ORGANISM: P. falciparum
| US-08-973-462-1

//note="Organ: shoot tips; Vector: Lambda TriplEx; Site_1:
Sfil (A), Site_2: Sfil (B); Shoot tips (approx. 2 cm from apex) were collected during the spring, frozen and used for mRAN isolation. The SMART-PCR method (Clontech) was used to prepare a library from 1 ug total RNA, using the Lambda TriplEx vector. Plasmid subclones in pTriplEx were recovered by cre-lox excision in E. coli strain BM25.8 and sequenced from the 5' end."

Asiegbu,F.O., Nahalkova,J., Choi,W., Stenlid,J. and Dean,R.A.
Expressed sequence tags of randomly selected cDNA clones from the
interaction of the root rot fungus (Heterobasidion annosum) with
seedling roots of Scots pine (Pinus sylvestris)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pinus sylvestris/Heterobasidion annosum pinus sylvestris/Heterobasidion annosum

    Pinus sylvestris/Heterobasidion annosum.
Pinus sylvestris/Heterobasidion annosum
Eukaryocis, mixed EST libraries.
1 (bases 1 to 510)
Asiegbu, F.O., Nahalkova, J., Choi, W., Stenlid, J. and Dean, R.A.
Expressed sequence tags of randomly selected cDNA clones from the interaction of the root rot fungus (Heterobasidion annosum) with seedling roots of Scots pine (Pinus sylvestris)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         404 AGGGCAGTTATTTCACTGCGTGGGCAGGGCCTGGTTGTAACAACCATGCTGCGCGATACA 345

/nab shoot tips; Vector: Lambda TriplEx; Site_1:
/nab solation: The Sh Noot tips (approx. 2 cm from apex) were collected during the spring, frozen and used for mRNA isolation. The SMATT-PCR method (Clontech) was used to prepare a library from 1 ug total RNA, using the Lambda TriplEx vector. Plasmid subclones in pTriplEx were recovered by cre-lox exclsion in E. coli strain BM25.8 and sequenced from the 5' end."
